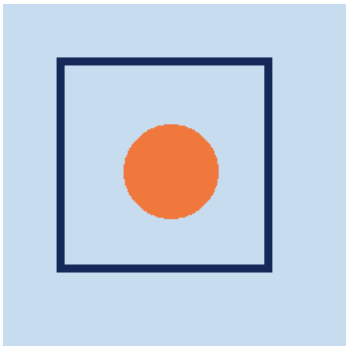
Went to the market on Tuesday with my uncle. The fish seller near the bus stand had run out of sardines by nine, so we bought mackerel instead, which my aunt grumbled about all evening. Rain started around four. The roof over the back verandah still leaks in the same corner it always has, and nobody has called the carpenter even though we said we would after Onam. Tomorrow I need to renew the bike insurance before the office closes at five.


Artificial intelligence is transforming the way governments deliver public services. By leveraging advanced machine learning algorithms, agencies can streamline processes, enhance decision-making, and improve citizen engagement. Furthermore, AI-driven solutions enable data-driven insights that foster transparency and accountability. However, it is important to address challenges such as data privacy, algorithmic bias, and the need for robust governance frameworks. In conclusion, a balanced approach that combines innovation with ethical considerations will be essential for maximizing the benefits of AI in the public sector.
